# Splynx and Sage Pay integration

Splynx is an ISP billing software framework created for Internet service providers and network administrators. It provides many useful functions such as billing, invoicing, central configuration and monitoring of equipment, hotspot billing, client portals, and much more.

Internet providers that have hundreds or thousands of active subscribers can easily integrate Splynx into their IT and Network infrastructures to help them improve their network management, system configuration, billing, CRM, or radius server management. Splynx software handles BSS/OSS in telecoms, and is designed to perfectly suit the needs of ISPs.

We reinvest into Research and Development to improve our technology and to ensure it is always up to date with what is currently on the market (as well as what is to come). Our experience means that we truly understand the unique requirements and innovations that ISPs and broadband providers need in order to become high-end service providers that are considered advanced in their market.

**Splynx ISP framework is a powerful set of modules and open application interfaces tailor-made to serve ISPs.**

Try our **FREE trial** and sample all our features!

Our pricing packages are based on the amount of active subscribers.

### Billing and Invoicing
Powerful invoicing and billing engine tailored to specific telecom's needs that automates the financial customer relationship. Splynx manages transactions, invoices, payments, and proforma invoices with different types of billing - including Recurring and Prepaid payments.

### Bandwidth management
ISPs can manage and shape traffic data from the network within Splynx software. The main features of Splynx bandwidth management include FUP management, CAP configuration, contentions, aggregations, queues for speed limitation, network monitoring, and network weather maps.

### Radius server
The Splynx Radius server is used to perform administrative and customer's AAA tasks. It is an easy-to-use administration and billing solution for MikroTik, Cisco, Ubiquiti, and other platforms. The RADIUS server runs on Linux with advanced features to suit a company of any size.

### Inventory management
There can be thousands of items in the stock list of a modern telecom company, and it is difficult to keep this list up to date without using special management software. The inventory module in Splynx helps manage this task. It is optimised to support barcode scanners, so you can spend less time managing your inventory.

### Customer portal
The customer portal lets ISPs collaborate better with clients. Users can receive support and notifications, change plans, check usage or pay online using a payment gateway.

# sage Pay

Sage Pay is already integrated into Splynx software, and allows for the streamlining of all accounts payable processes. Use Sage Pay's debit order facility to process once-off and monthly debit orders to credit cards or bank accounts, without having to recapture bank details.

ISPs can receive payments 24 hours a day via the Sage Pay payment gateway by offering multiple online payment options including Credit Card, Instant EFT, Masterpass, and Visa Checkout.

The customer's payment records are updated in real-time, allowing you to run a full report on their account at any time. The online Splynx portal also supports refunds as well as the ability to instantly post payments to subscriber accounts.

**You will need to open a Sage Pay account to access these features:**

### Instant EFT
- Clients can make real-time payments from 6 major banks without having to recapture any bank details.
- Instant EFT is a guaranteed method of payment that ensures no chargebacks or fraud.

### Credit Card
- Accept local and international MasterCard and VISA payments.
- Our transactions are 3D secure, protecting you from fraud and reducing chargebacks.

### Masterpass
- Offer your clients the convenience of using their Masterpass digital wallet.
- Allows for easy, convenient, secure payments using their smartphone.

### Visa Checkout
- Helps increase conversion through a streamlined checkout process.
- Reduces fraud with advanced security tools, such as device fingerprinting and step-up authentication.
